Providing access to the latest data centre solutions from the market's leading vendors, we'll help you **assess, design and deliver** against your organisation's current and future infrastructure needs.

A fully modernised automated data-centric data centre is critical for the flawless delivery of today's hyperconnected digital services. It will also make it possible to execute a hybrid or multi-cloud strategy with confidence and inject new levels of flexibility and agility to the business.

Whether you're looking to compute at scale to accommodate the growing use of AI and analytics, or need to enhance the operational efficiency, extensibility and resilience of your architecture in line with evolving workloads, your data centre needs to be built with future performance, capacity and environmental sustainability in mind.

Designing, building and supporting data centres requires careful strategic planning of everything from compute and storage resources as well as software-defined and fully orchestrated and serverless technologies, through to network security, application delivery assurance, intelligent automation and redundancy. And that's where Bell Integration can help.

### Bell Integration – delivering a complete end-to-end solution

Whether you're planning to modernise your on-premises data centre or are looking to build out a new co-location facility, our **cutting edge and cost effective** DC infrastructure solutions improve agility, security and control.

#### Our Approach

**Assess and review** - We'll audit your existing environment, evaluating current and envisaged workloads alongside potential security risks and space constraints.

**Design and build**- We'll help you evaluate which technologies from which vendors represent a best fit for your needs, providing expert advice that ensures your data centre is designed with optimisation and future-proofing in mind. At every stage of the process, you'll be able to take advantage of our proof-of-concept testing labs and we can provide IT rental options that make it cost-effective to try out your infrastructure design for real.

**Implementation**- We take care of everything from hardware storage and logistics through to configuration and imaging of your new environment. Utilising our unique VClaruss methodology, we'll execute the phased installation and data centre staging and testing process utilising our own fully certified and security checked engineering personnel.

Our IT asset management specialists are on hand to ensure you make the best use of existing resources, while our migration teams will undertake the smooth switchover of workloads to your new environment. We can also help you handle the secure collection and sustainable disposal of any decommissioned and redundant IT assets.

**Support** - Expert at helping organisations build and manage future-ready data centres, we'll take care of everything from maintaining your data centre hardware and software, to 24x7 monitoring of everything from bandwidth scaling and application performance to usage changes.

Alongside minimising downtime and risk, we'll ensure that data recovery and application and network availability metrics are tightly managed. Plus, we'll ensure you benefit from increased operational efficiencies that result in improved energy and cooling costs.

We will help you prepare for emerging and next-generation technologies that can power further future innovation.

#### Contact us

From offices in London, Portsmouth, Wokingham, Krakow, Hyderabad and Singapore, we work with local and global customers across Europe and Asia-Pacific to streamline every aspect of their IT management strategies to maximise efficiencies and increase their ROI, year on year.
